

**Mechanical
machining and
manufacturing**

Company Profile

Since 1984, we have combined experience and solid industry expertise with the precision and efficiency of the latest technologies we use every day.

Saracchi Srl was established with the specific aim of delivering precision mechanical machining.

Over the years, our company has manufactured machines and assembled mechanical equipment for third parties, consistently driven by the ambition to ensure the quality of our products and services while contributing to the growth of the industrial sector.

We operate according to a solid corporate policy focused on customer satisfaction and are certified under the ISO 9001:2015 quality management system.

Another key element is the expertise and adaptability of our specialists, who are capable of working with a wide range of machines and materials to deliver exactly what our customers require.

We are committed to continuous improvement and collaborate every day with specialized partners to expand our know-how and consistently drive innovation.

CAD design and CAM programming

We support our customers in carrying out precise, customized analyses aligned with their needs, parameters, and requirements.

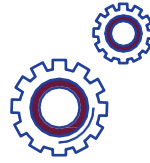

The capabilities offered by CAD-CAM enable us to perform detailed work simulations; this allows us to develop and manufacture all components with precision and consistency. Our company conducts pre-design studies and analyses, creates 3D models of older parts, rebuilds samples through advanced tools when drawings are no longer available, and manages the design of individual components as well as complete machine assemblies.

Dimensional inspection

We carry out planned quality inspections tailored to the specific requirements of each product.

We have advanced measuring instruments managed through dedicated software, and we are able to perform quality checks not only in the final stage but also directly at the machine.

Mechanical machining

We perform CNC turning and milling operations with cutting-edge equipment.

We provide high-level mechanical machining, ensuring versatility, prompt delivery, and outstanding product quality.

Our machine fleet allows us to manufacture a wide range of components and to precisely track and manage each defined production cycle, guaranteeing a consistently high-quality standard.

Our production capabilities range from unique prototypes to the industrialization and execution of large-volume batches.

In milling, we work on parts with volumes up to 8000 × 2500 × 1500 mm.

In turning, we handle diameters up to 700 mm and lengths exceeding 3000 mm.

Mechanical assembly

We are capable of assembling components of high complexity.

We have a dedicated mechanical assembly department with specialists capable of assembling highly complex components.

Mechanical testing is also carried out upon customer request
